

# CONTINUITY

Typically, we think of a graph as being **continuous** at all real numbers if its graph represents a curve that can be drawn without having to lift one's pencil off the paper.

$$y = x^3 - 8x + 1$$

**Continuous at all real numbers**

Similarly, a graph is **discontinuous** at a real number if its graph has a break at that point.

$$y = \frac{1}{x}$$

**Discontinuous at all  $x = 0$**

We can define continuity at a real number  $a$  using the concept of a limit.

DEFINITION: A function  $y = f(x)$  is continuous at a real number  $a$  if  $\lim_{x \rightarrow a} f(x) = f(a)$ .

We also can make this definition a little easier to grasp by breaking up the condition into three parts.

DEFINITION: A function  $y = f(x)$  is continuous at a real number  $a$  if:

1.  $f(a)$  exists
2.  $\lim_{x \rightarrow a} f(x)$  exists
3.  $\lim_{x \rightarrow a} f(x) = f(a)$

These criteria describe three ways in which a function can fail to be continuous at a real number.

DEFINITION: A function  $y = f(x)$  is continuous at a real number  $a$  if:

1.  $f(a)$  exists
2.  $\lim_{x \rightarrow a} f(x)$  exists
3.  $\lim_{x \rightarrow a} f(x) = f(a)$

Let's now look at a few examples.

DEFINITION: A function  $y = f(x)$  is continuous at a real number  $a$  if:

1.  $f(a)$  exists
2.  $\lim_{x \rightarrow a} f(x)$  exists
3.  $\lim_{x \rightarrow a} f(x) = f(a)$

1.  $f(x) = \frac{1}{x^2 - 4}$

**The function is discontinuous at  $x = -2$  and  $x=2$  since the function is undefined at these values.**

$$2. f(x) = \begin{cases} x-1 & \text{if } x < 0 \\ -x+1 & \text{if } x \geq 0 \end{cases}$$

The function is discontinuous at  $x = 0$  since  $\lim_{x \rightarrow 0} f(x)$  does not exist.

$$3. f(x) = \begin{cases} x & \text{if } x \neq 0 \\ 1 & \text{if } x = 0 \end{cases}$$

The function is discontinuous at  $x = 0$  since  $\lim_{x \rightarrow 0} f(x) \neq f(0)$ .

## To find real number values at which a function is not continuous:

1. Examine both the function and its graph.
2. Look for values at which  $f(x)$  is not defined.
3. Look for values at which  $\lim_{x \rightarrow a} f(x)$  is not defined.
4. Look for values at which  $\lim_{x \rightarrow a} f(x) \neq f(a)$ .
